

# JetFog Cooling System

Low pressure livestock fog system  
by

# DRAMM

Unlike most fogging or misting systems the Dramm JetFog cooling system runs off typical farm system pressure (50-60 psi) so additional pumps are not required. Nozzles are typically spaced on 4' centers in front of inlet openings directing a fine mist into the incoming air path providing an evaporative cooling effect without wetting the floor.

The unique PolyRail system combines black poly pipe with a rigid aluminum support for flexibility to adapt to any ventilation setup. Systems can typically be installed in a day providing quick improvement of your existing ventilation system.

Pre-fabricated manifold panels are available and incorporate a filter and zone solenoids tailored to your site for precise control.

These panels can also incorporate the Mist Time controller which can be programmed according to your needs.

- Can operate on time / temperature for precise control
- Multiple zone outputs possible
- Pump pre-start as an option - this would ensure the system pressure is 50PSI when zones are activated
- NEMA4 housing (durable and water resistant)
- 120V or 240V supply, 24V solenoids all prewired for simple installation process
