

Proven During Heat Stress to Keep Birds Alive While Saving Water!

The Only Complete System for:

Cooling During Heat Stress

- Drastically reduces mortality and backing off of feed
- Will reduce water usage by up to 50% when combined with cool cells or when replacing fogging/misting systems

Activity Promotion—Year Round

- Creates cyclical drinking patterns
- Improves feed conversion

Dust Control

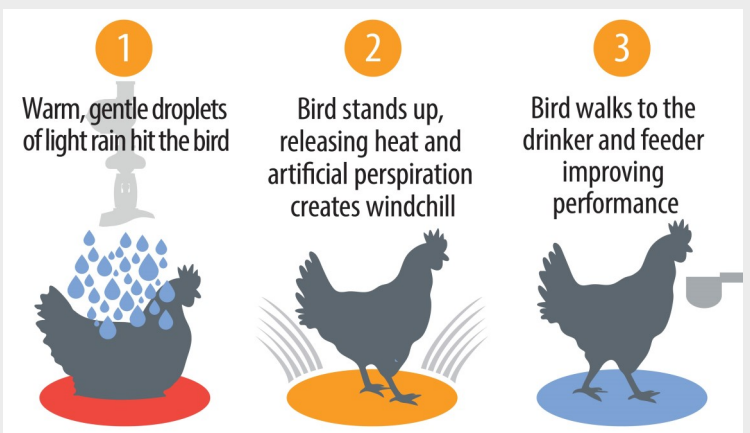

- Dramatically improves the environment
- Minimizes the spread of dust-carried pathogens

The Concept of Cooling and Activity Promotion

When the Weeden Sprinkler System® turns on in short pre-set durations, the warm gentle rain droplets hit the birds and provide artificial perspiration. This causes them to stand up and releases captured heat underneath. Once up, the birds migrate to feed and water.

A wind chill is then created by moving air across the birds and cooling them as the water droplets on their heads and backs evaporate between each sprinkling.
