

Proven During Heat Stress to Keep Birds Alive While Saving Water!

The Only Complete System for:

Cooling & Conserving Water During Heat Stress

- Will reduce cooling water usage by over 50% when combined with cool cells or when replacing fogging/misting systems
- Drastically reduces mortality and backing off of feed
- Maintains humidity as low as possible for as long as possible

Activity Promotion—Year Round

- Creates cyclical drinking & eating patterns to enhance feed conversion
- Exercises the birds to improve muscle and joint strength

Dust Control

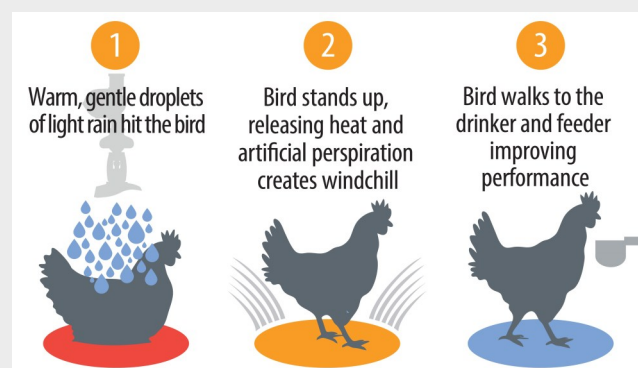

- Provides a healthier environment for the birds and the farm workers
- Minimizes the spread of dust-carried pathogens
- Research shows dust reduction of over 50%

The Concept of Cooling and Activity Promotion

When the Weeden Sprinkler System® turns on in short pre-set intervals, the warm gentle rain droplets hit the birds and provide artificial perspiration. This exercises the birds as they stand up and release captured heat underneath. Once up, the birds migrate to feed and water.

A wind chill is then created by moving air across the birds and cooling them as the water droplets on their heads and backs evaporate between each sprinkling.
